

ComboValve

“One Less Valve is The Advantage”

The ComboValve Does Double Duty Replacing the Need for Two Valves

- One valve does the job of two
- Simple design is easy to disassemble and maintain
- Rugged corrosion resistant construction
- For safety, spring maintains valve in off position until activated by operator
- Uses common 3/4" 4-ply blast hose for exhaust
- Extended length exhaust hose can be used to port exhausted air to any desired location
- Assembled by Axxiom technicians with Schmidt experience
- All Axxiom valves undergo a thorough quality check before they are shipped

“The ComboValve reduces costly downtime”

The ComboValve is a normally closed, self sealing, fail-safe valve that combines the functions of the air inlet valve and exhaust valve, eliminating premature failure of the exhaust system. It is controlled with either pneumatic or electric remote controls. None of the usual wear or failures found in other blowdown systems can occur with a ComboValve. The ComboValve eliminates the need for abrasive traps, expensive plungers and diaphragms that can cause frequent, unscheduled and costly downtime.
